

Dynamic Forecasting Tool Boosts Efficiency & Satisfaction

By leveraging new custom software development, this financial services firm reduced its time to review, buy, and sell products by two hours per day, which also improved customer service.

Cloud-based Web App

Portfolio Assessment Tool

"Legacy software systems prevented agents from properly forecasting potential gains or risks associated with different opportunities."

Scenario

A financial services firm was struggling to provide high-profile clients with up-to-date financial investment portfolio info. Their legacy software system prevented agents from properly forecasting potential gains or risks associated with different opportunities. Additionally, the system had no automations, forcing agents to spend hours calculating scenarios manually, leading to outdated reports and poor customer service.

Knowing that they needed a better tool to forecast and showcase accurate reports, this financial firm decided to partner with AltSource, a custom software development company in Portland.

Solution

After an in-depth discovery process, AltSource designed the technology roadmap that would help this financial firm save time and provide better customer service.

First, AltSource created a custom portfolio assessment tool that enabled financial professionals to gather data to efficiently and sustainably advise clients. By putting this solution into a cloud-based web application, AltSource

helped the firm centralize its database, providing a simpler way to gather and share the most accurate data from a single source.

A centralized database also allowed agents to input proposal investment changes and see projected results in real-time, giving their clients more accurate recommendations about investments.

Business Impacts

Centralized Data

Information stored in the cloud empowered agents to get up-to-date forecasting data and provide better recommendations to clients.

Unified Reporting

Firm-wide reports now tracked asset allocation, variance, valuation, change projections, and more, giving the firm improved visibility of the business.

Automated Actions & Workflows

With a centralized database and improved reporting, automated actions and workflows could be implemented to save time and improve efficiency.

Better Use of Employee Skills

Employees no longer had to waste time with manual data entry and reporting, and could now use their time for higher-value tasks.

Improved Customer Service

Agents could now provide customers with the detailed holistic reports they craved, increasing customer satisfaction and retention.
