

Modernizing inventory management with a web app
for improved data access and increased productivity.

Web Applications

Inventory Management

"When you use an old inventory management system every day, you just kind of deal with it. But when the system started to get in our way, we knew we needed a change. AltSource helped us understand how to get to where we wanted to be."

Sally Clipfell

Controller, Cascade Meats

Scenario

Cascade Meats, a subsidiary of BrucePac, purchases meat to manufacture pre-cooked meat products. As the company has grown, it was time to overhaul their 20-year-old system used for tracking the purchasing and selling of meat products.

Like many legacy inventory management systems, Cascade Meats' system had unnecessary features, a lack of search functionality, no role-based workflows, and limited remote accessibility. Additionally, their tech was dependent on older operating systems, making roadblocks for their IT department to fix.

Solution

The AltSource team met with Cascade Meats to identify their system needs, users, workflows, and goals. One of the first recommendations was to go from a legacy system to a cloud-based web application that could handle modern APIs and provide remote access.

As part of the app, AltSource built workflows and functionalities to improve data entry processes and automate them.

Additional automation was added to purchase orders and invoices to calculate storage charges, interest rates, and other fees.

With the ability to create purchase orders and invoices more accurately through automated data, the app allowed Cascade Meats to produce both known and ad hoc reports to keep better track of all related activity.

Business Impacts

Reduced Data Entry Time

With the web application managing the data, information for each account is automatically updated in all necessary fields.

Automated Workflows

As different users create purchase orders, their actions trigger different workflows to send orders to the system, create invoices, and monitor information.

Increased Forecasting Capabilities

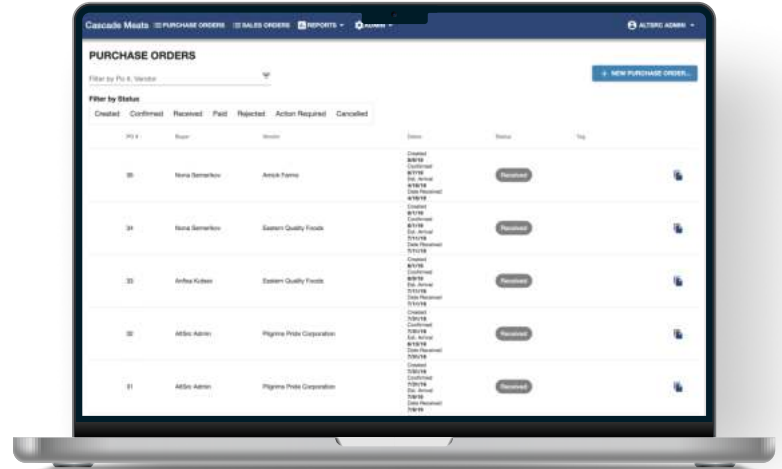

Access to all data through the web application allows users to run reports so that they can forecast more accurately and improve key business metrics.

Improved Communication with Vendors

By giving vendor partners access to input orders on the web app, Cascade Meats can more quickly fill those orders and deliver optimal service.

QuickBooks Integration

This API effectively connects Cascade Meats' inventory management web app to their accounting department systems for real-time data and reporting.

"Automated data entry has brought our purchase orders into the 21st century."
